Re: Letter of Recommendation

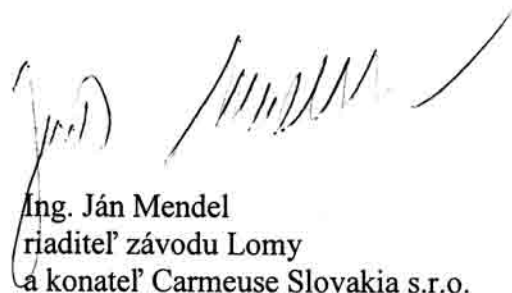

The objects in our plant have been heated by the steam and hot water from the central exchange station until the year 2003, applying the media distribution into the individual halls and maintenance hall. The possibility of energy consumption regulation and control was the minimum one. The heating medium – steam has been purchased from the external supplier.

At the beginning of 2004 realised was the gas supply for the heating system in accordance with the technical solution provided by SEWA Consulting, s.r.o., from the medium pressure connection, regulation station, distributor, additional measurement and regulation points up to the appliances selection (buildings – gas fired boilers, maintenance hall – light gas fired infra red radiators).

After the completion of one year operation, the savings related to the heating media purchase costs, were about 75 %.

With regard to the above fact, we are highly satisfied with the design and implementation jobs provided by the company SWA Consulting and we keep in contact in field of the technical service assumption of all gaseous appliances.
