DETVA, this May 2, 2005

Dear Company,

This standpoint related to the selection of the heating, heating technology and aeration method of our production premises, has been elaborated subject to the request of the company SEWA CONSULTING s.r.o., Košice. In the year 2004, we had in PPS Group a.s. Detva the tender related to the supplier of the heating and aeration system for the production hall where prevailing production includes the welding and materials division.

We have chosen the proposed method of the technical solution – gas fired infrared radiators and venting units due to the lower investment and operational costs, assuming the wall to wall and local method of premises heating and tempering.

In total, we have fixed more than 150 pieces of light gasfired infra red radiators and 28 pieces venting gaseous units.

These appliances have proved to be satisfactory for their operational variability, premises heating effectiveness and advantage from the point of investment.

Sincerely

**Ing. Jozef ĎURICA**
