Re: Standpoint in the matter of heating

Our company started to consider about the heating technology of our production halls replacement by the local infra red radiators.

Originally proposed have been dark infra red radiators, however they did not meet the requested parameters in course of the test operation, even with regard to the construction and building features of our halls.

Consequently, we have replaced the dark infra red radiators by the light radiators, supplied by the company SEWA Consulting s.r.o. At the present time we operate several gas fired infra red radiators in the premises, where our workers spent majority of their time or where the technology of our foundry plant calls for it.

Applying the light gas fired infra red radiators achieved has been higher efficiency of the production hall heating and not negligible is also the workers satisfaction at the sites where installed have been the light infra red radiators.
