Re: Letter of Recommendation

In November 2001, our company Taylor Wharton-Harsco has decided, following to the tender results, to order the company SEWA Consulting, to realise the gas distribution system implementation and production hall heating provision in USS premises. We have decided to implement this method of heating for its installation and operation technical variability. SEWA Consulting has executed the entire building in form on turn key building, along with the high pressure gas connection and regulation station. We have aggregated installed thermal input of 2900 kW assumed by the light infra red radiators, these being highly flexible from the point of their operation. The hall is heated in the individual zones, which are divided in sectors and in total there are eight heated sectors. The infra red radiators regulation is in two stages, controlled by the microprocessor and in such a manner the operational consumption of natural gas is fully automated.

SEWA Consulting employees have conducted high quality job on the particular technical equipment and observed the terms of the building realisation in agreed dates. Our co-operation continues, the company assumes for us the expert revisions and tests of high pressure gas fired infra red radiators and their service.
